Phytomangement to restore degraded sites and achieve wider benefits – the GREENLAND project

Professor Andy Cundy
Ocean and Earth Science, University of Southampton

With Professor Paul Bardos, R3 Environmental Technology Ltd / University of Brighton, and Dr. Markus Puschenreiter (BOKU, Vienna, Austria) and the GREENLAND project team.

Vitoria-Gasteiz summer course (PhytoSUDOE 13-14 July, 2017)
Content

1. Context: Contaminated land, GROs, phytomanagement and soft re-use
2. Soft re-use and wider benefits
3. The GREENLAND project
4. The GREENLAND decision support framework
5. Concluding thoughts – from Brownfields to Green Fields

These projects have received funding from the European Union’s Seventh Framework Programme for research, technological development and demonstration under grant agreements No 265097 and 266124.

This presentation reflects only the authors’ views. The European Union is not liable for any use that may be made of the information contained therein.
Historically, approaches to contaminated site risk management have focused on containment, cover and removal of contaminated soils to landfill.

Since the late 1990s, move towards treatment-based remediation strategies.

Number of these alternative technologies utilise an in-situ, less invasive/low impact approach whereby plants (trees, shrubs, native grasses etc) are used for managing site risk – phyto- or “gentle” remediation approaches (GRO)

GROs: risk management strategies or technologies that result in a net gain (or at least no gross reduction) in soil function as well as achieving effective risk management
Phytoremediation / phytomanagement – common GROs

Phytoextraction

In situ immobilisation
Aided phytostabilisation

Translocation
Uptake
Accumulation

Soil amendments

( + phytomining applications for Ge, Ni, Au)?
Phytoextraction is only part of the story......

**Phytomanagement**: the long term combination of profitable site use with GROs which leads gradually to the reduction of contaminant linkages and the restoration of ecosystem and other site services.

*Refers to a wider design and management strategy which, alongside risk management, places realisation of wider (including economic) benefits at the core of site design, and uses GROs as part of integrated site management strategies.*
Intelligently applied GROs can provide rapid risk management via pathway control, through containment and stabilisation, coupled with a longer term removal or immobilisation of the contaminant source term, plus wider economic, social and environmental benefits.
Particularly useful in cases:

1. Where there are large treatment areas, particularly where contamination may be causing concern but is not at strongly elevated levels
2. Where biological functionality of the soil is required after site treatment
3. Where there are budgetary constraints
4. Where there are deployment constraints for land remediation process plant (e.g. as a function of area and location).

As the treated soil remains unsealed, GROs are highly applicable to soft-end use for a site....
What is soft re-use?

- “Hard Re-Use”
- “Soft-Re-Use”

Building or infrastructure

Often combined

Unsealed soil
Potential services from soft re-use

- Site value uplift / value uplift of surroundings / framing built development
- Renewable energy generation
  - Biomass based
  - Geothermal
  - Wind
  - Solar
- Renewable material generation
- Greenhouse gas mitigation (carbon offset revenue?)
- Synergies with waste processing and re-use, leachate management
- Shielding / sound-scaping
- Flood management – link with SUDS

- Amenity and leisure
- Urban climate management (such as mitigation of urban heat island effect)
- Air quality management
- Habitat and conservation
- Improved soil and water resources
- Improved health and well-being
- Opportunities for education
- Community involvement
- *Ecological system services*
Cundy et al., 2016
These services provide value

- Revenue Generation Opportunity
- Natural Capital
- Cultural Capital
- Economic Capital - tangibles
- Economic Capital - intangibles
GRO – more sustainable remediation?

Opportunity to use GROs to support potentially self-funding land management for brownfield and degraded areas unsuitable for built developments, such as former landfills, industrial sites and agricultural land damaged by diffuse pollution

Economic leveraging for site redevelopment with wider benefits.......
Soft re-use and benefits - examples

Beam Parklands, Dagenham, London

53 ha functional flood prevention area.
The Land Trust secured funding from a number of sources to enhance the space and to sustainably manage it as an attractive multi-functional community asset, alongside the Environment Agency's flood defence improvement works.

Land Trust ownership model allowed transfer of land and associated liabilities on long term lease to the Trust
Provides significant community benefits and is helping regenerate a deprived area.

http://www.thelandtrust.org.uk/business/sites.html?SID=beamparklands
Soft re-use and benefits - examples

Betteshanger, Kent

Former coal mining site of 120 ha. Regenerated between 2002 and 2011.

New use: Country Park with provision for walking, cycling, horse-riding and wildlife observation, plus warehousing, office and industrial space (inc parkland, “soft cover” and wetlands).

Complexity and profile of site meant need for long-term and extensive stakeholder collaboration, e.g. masterplan for regeneration revised significantly in response to public consultation.

BUT

Despite widespread use of “green” technologies such as landscaping, application of green cover, reedbeds and constructed wetlands in remediation and urban / industrial regeneration, application of phytoremediation/GRO as a practical site risk management tool is still in its relative infancy
So why are GRO not widely applied as practical site solutions?

The main barriers to widespread GROs application, in Europe and more widely, derive from a general focus of the remediation sector on remediation for critical risks, or to rapidly return smaller urban brownfield sites to productive use e.g. for housing.
So why are GRO not widely applied as practical site solutions?

- Effective performance on large field scale (up-scaling) remains to be consistently demonstrated
- Management routes for potentially contaminated plant biomass need to be tested
- Decision support tools do not sufficiently consider GRO (Onwubuya et al, 2009)
- At metal contaminated sites, the success of GRO is mostly reflected by changes in contaminant bioavailability rather than in total concentration, which is currently not sufficiently considered by legal frameworks
- Stakeholders and decision makers are not well informed, or have negative perceptions, about GRO as practical site solutions
GREENLAND – Gentle remediation of trace element contaminated land*

The GREENLAND project has adopted a transparent and simple plan of action to address these impediments. It has:
1. co-ordinated data collection from a range of long-duration GRO pilot projects at contaminated sites across Europe,
2. evaluated standard protocols and methods for site monitoring, and
3. developed a set of specific design aids (for use when GRO appear to be a viable option) to promote the appropriate use of gentle remediation options and encourage participation of (and inform) stakeholders.

* FP7-KBBE-266124; 2011-2014
GREENLAND – Gentle remediation of trace element contaminated land*

The GREENLAND project has adopted a transparent and simple plan of action to address these impediments. It has:

2. evaluated standard protocols and methods for site monitoring, and
3. developed a set of specific design aids (for use when GRO appear to be a viable option) to promote the appropriate use of gentle remediation options and encourage participation of (and inform) stakeholders

* FP7-KBBE-266124; 2011-2014
GREENLAND – Gentle remediation of trace element contaminated land*: Project Objectives

- Assess the efficiency tested in long-term (> 5 year duration) field trials
- Test the possibilities for biomass valorisation
- Evaluation of a set of soil tests to assess GRO performance
- Enhance the efficiency of GRO (e.g. by selection of most effective plants, microbes, and soil amendments)
- Development of a decision support system, stakeholder engagement guidance, and publication of a guide for practical application

* FP7-KBBE-266124; 2011-2014
Key output of the GREENLAND project is to develop and trial / evaluate practical decision support tools (based on Greenland and other case studies), focussed on GRO, which
(a) can be integrated into existing, well-established and utilised (national) DSTs / decision-frameworks, to ensure ease of operation and wide usage;
(b) can be used to inform and support remediation option selection by wider stakeholders (consultants, planners etc).
GREENLAND decision support framework

**Phase 1**
*(Initial concepts / Feasibility)*
- Definitions and scope of GRO; contaminant matrix for GRO applicability assessment; examples of practical field-scale GRO application

**Phase 2**
*(Exploratory stages / Confirmation)*
- Stakeholder engagement; sustainability assessment; outline cost-calculator “modules”

**Phase 3**
*(Design stages)*
- Technical assessment and GRO “operating windows”

---

*Increasing complexity and time investment*

- Site / risk assessment
  - Options appraisal
    - Implementation of remediation strategy
      - National guideline / DST

Contaminant matrix

Quick reference: Are GRO applicable to your site?
Key questions:
Does the site require immediate redevelopment?
Are your local regulatory guidelines based on total soil concentration values?

If YES, are GRO potentially applicable?
Unlikely (except immobilisation / phytoexclusion which can show immediate positive effects)

Unlikely for phytoextraction but possibly for some other GRO

Considers wider GRO-based risk management strategy, tailored along contaminant linkage model.

Source
Pathway
Receptor
Gradual removal or immobilisation of source term
Reduction in labile pool, rapid reduction in flux of contaminants to receptors at significant risk
Using vegetation to manage receptor access to the subsurface

Such pilot-scale applications of effective GRO strategies (i.e. “success stories”) are key in providing robust technical and practical data for GRO implementation and in engendering confidence in stakeholders, both in terms of illustrating the long-term risk management potential of GRO but also in showing how wider economic, environmental and societal benefits can be realised.

Pilot sites can also be pivotal in education and training as demonstrator sites, both for specialists (e.g. regulators, contaminated land consultants) and nonspecialists.

<table>
<thead>
<tr>
<th>Sustainability Elements</th>
<th>Source Parameters</th>
<th>Information Sources</th>
<th>Key Decisions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Environment</strong></td>
<td>Procedure 1</td>
<td>Procedure 1, SURF-UK: indicator descriptions</td>
<td>Procedure 1</td>
</tr>
<tr>
<td></td>
<td>Use SURF framework and retrieve headline indicators</td>
<td></td>
<td>In order to establish and consider possible impacts that a remediation option (s) may have on the environment, a semi-quantitative assessment approach can be utilised in form of a Multi Criteria Analysis (MCA). Sustainability indicators (as detailed in the SURF indicator) should be identified using the information source (weblink) provided. The indicators to be considered can then be ranked in form of greater or lesser importance (e.g. 3 - High /2- Medium/1-Low weighting), and then scored (out of 5). A ranking order can then be established accordingly to show most suitable to least suitable technology.</td>
</tr>
<tr>
<td></td>
<td>Outline various parameters that may be considered in a typical LCA procedure. Information will be retrieved from source which will be highlighted in the 'information sources' column. Utilises EPA sponsored website LCAccess which provides abundance information regarding Life cycle inventory data sources. The primary focus of this source is on LCI databases and LCI data providers. Follow link provided in the 'information sources' column.</td>
<td></td>
<td>This step can be considered in tandem with Procedure 1 or afterwards if additional information is deemed necessary. A more complicated LCA quantitative assessment can be carried out. An LCA inventory should be collated using any of the applicable sources outlined in the web address provided and full life cycle analysis carried out. This, however, is a resource hungry process and requires huge time investment. Following the review of the indicators, all applicable indicators should be considered during DST selection.</td>
</tr>
</tbody>
</table>

### Recommendation

*Expert advice and plant toxicity tests are recommended*
Additional tools supporting Phase 3 (Design Stages)

Technical datasets (*cultivars and amendments, safe biomass use, indicators of success and methods, stakeholder engagement guidance*) and design / implementation guidance

GREENLAND: FP7-KBBE-266124

Appendix 6: Stakeholder engagement guidelines for application of “gentle” remediation approaches (GROs).

Introduction

*Definitions and key concepts*

Stakeholder engagement is a broad inclusive and continuous process between a project and those potentially affected by it. The World Bank (2012) describes the aims of stakeholder engagement as building up and maintaining an open and constructive relationship with stakeholders and thereby facilitating a project’s management of its operations, including its environmental and social effects and risks. Effective stakeholder engagement is also seen as reducing key remediation project risks, for example failure to gain acceptance and delays due to antagonistic relationships; and also as means of reducing project management costs and timescale (RESCUE 2005; REVIT 2007).

*Need for stakeholder engagement when applying GRO.*

Stakeholder involvement has been identified as a key requirement for the optimal application of sustainable remediation strategies (CL:AIRE, 2011), and in site regeneration more widely (REVIT, 2007; RESCUE, 2005). Effective and sustained stakeholder engagement is critical to the acceptance of GROs, particularly for larger
A practical, usable tool to interface with existing DSTs (e.g. HOMBRE) and national guidance.......

Aims to communicate the potential wider benefits and risk management capabilities of GRO, supported by information on large-scale examples of successful GRO application, presented in a robust and non-technical way.

The guidance can be used to support site planning, options appraisal, stakeholder engagement and consideration of initial design scenarios, and wider education of the potential risk management capacity and economic, environmental and societal benefits of GROs.

Available at: www.greenland-project.eu
Concluding thoughts

The GREENLAND guidance promotes a refocus from phytoremediation to wider phyto-management-based approaches which place realisation of wider benefits at the core of site design, and where gentle remediation technologies can be applied as part of integrated, mixed, site risk management solutions or as part of “holding strategies” for vacant sites.

Combination of GROs with renewables, for biomass generation but also with technologies such as wind and solar power, can provide a range of economic and other benefits, and potentially support the return of low-level contaminated sites to productive usage.

Combining GROs with urban design and landscape architecture, and integrating GRO strategies with sustainable urban drainage systems and community gardens/parkland (particularly for health and leisure benefits), has large potential for triggering GRO application and in realising wider benefits in urban and suburban systems.

Quantifying these wider benefits and value (above standard economic returns) will be important in leveraging funding for GRO application and soft site end-use more widely at vacant or underutilized sites.
